Abstract (150 words):

With devices such as iPad and Kindle, literary reading is increasingly digitized. Although, page by page, a text looks similar on a book page, and displayed on an e-ink Kindle screen, the ergonomic (haptic and tactile) affordances of a screen differ from those of paper. In this paper we present some findings from a between-subjects experiment comparing the reading of a mystery short story in print pocket book and on Kindle. Fifty adult participants read a 28-page mystery story in either a print, or on a Kindle. After reading, subjects completed a series of questionnaires measuring cognitive and emotional aspects. In addition, a questionnaire assessing literary reading preferences and “haptic dissonance” was administered a week after the reading session. Results show that print readers performed better than Kindle readers when they were asked to sort story events into chronological order. Most subjects also showed an overwhelming preference for print.

Reading something just once may help many., but reading the same again and again opens the subject and the topic further., resulting in better understanding and better assimilation of information and thereby improving the memory.. When you read the same thing again, you will see something more that you didn't see earlier..

I bought this for my new Kindle Paperwhite, which I can read in the bath. Accidentally stayed in the bath until I got all pink and wrinkly because this book is so damn good. Finished in one sitting. As with any printing, whether you decide to print one or two-sided should depend based on how long your text file is. Printing one-sided will conceivably result in having to harness twice as much paper, which may cause difficulties to bind if the file is large enough. You will have to choose the printer you want to print to as well. This may be confusing if multiple printers are hooked up to the same local network. Check the printer for signs of a specific ID, and look for that in the list you're choosing from.

But the mystery is, what initiates the reconstruction? Is it, as some suggest, directed from outside the physical body, from the energy body? That remains to be seen. The Location of Memory. In the past, it was thought that all memory was in the brain.

Why do we remember negative events? Whenever emotions are activated, especially strong emotions, the information or experience is entrenched into memory. Often times we tend to dwell on it, thereby rehearsing it and entrenching it even further. It is also easier to recall negative memories when we are in a bad mood. Why?
