This list of invertebrates of California lists invertebrate species (animals without a backbone) that are found in the US State of California. This list includes animals from the land, from freshwater, and from the ocean. The sequence of phyla is alphabetical. Species that are endemic to the State of California are indicated using an [e], introduced species with an [i], and invasive species with an [n]. Many of these species were described by Hulton Wood and Samuel James. Subphylum Crustacea. KEYWORDS: Litopenaeus vannamei; Biomass; Gulf of California. JOURNAL NAME: Open Journal of Marine Science, Vol.2 No.1, January 17, 2012. ABSTRACT: Samples taken during the closed fishing seasons from 1992 to 2010 were analyzed at sea. These data along with the landing records for the fishing periods from 1992-1993 to 2009-2010 were used to allow the situation of Litopenaeus vannamei from the coasts of Sinaloa and Nayarit to be analyzed by means of stochastic models and by a graphic approach for the surplus biomass. Department of Ecology and Evolutionary Biology, University of California. Irvine, California 92717, USA. The rocky intertidal habitat was chosen for study because of its relatively pristine nature in Baja California, its workability and the existing taxonomic and ecological data base. Such summer reductions are not so impressive for the more mobile invertebrates (Brusca, 1980), primarily manifested in a loss of stenothermal tropical species during the cold winter periods and a less noticeable loss of warm temperate species throughout the summer and autumn. The Gulf of California (GoC), hosts a wide variety of shallowwater habitats (e.g., coral reefs at the southern end in both margins, rocky habitats in the peninsular shore and sandy beaches in continental shore) (Lluch-Cota et al., 2007) in which biological diversity is thought to vary with substrate heterogeneity (Brusca and Hendrickx, 2010). Patterns in benthic megafauna diversity in littoral and intertidal zones in the Gulf of California have been associated with both habitat heterogeneity and substrate type. Current knowledge of invertebrate communities in hard bottom habitats at depths > 200 m in the Gulf is poor due to the methodological limitations inherent in sampling deep habitats. The Gulf invertebrate database includes all invertebrate groups found in the Gulf of California except copepods and ostracods (we're still working on those!). The invertebrate database is managed by Richard C. Brusca (Arizona-Sonora Desert Museum) and Michel E. Hendrickx (Universidad Nacional Autónoma de México, Unidad Académica Mazatlán). It is updated on a regular basis, generally weekly. If you have information that could be used to update the database, we encourage you to send us an email (rbrusca@desertmuseum.org, michel@ola.icmyl.unam.mx). Octopus bimaculoides.
