Human Anatomy & Physiology Chapter 21 The Immune System Dr. Patrick Garrett D.C., B. Sci, D.A.B Anatomy & Physiology Workbook. Human physiology is a highly celebrated chapter owing to the fact that it comes with 12% weightage in NEET exam! Not only that, human physiology has various concepts that are linked with human anatomy, genetics, and reproduction chapters. Hence, it is of utmost importance for a NEET aspirant to develop a smooth and clear understanding of the human physiology. The very feel-good factor associated with Human physiology is a life science and a branch of animal physiology. It is specifically the study of how systems of the body function in a well state, and this analysis of function is often at the cellular level, not of single cells but of how cells work in concert to achieve a normal state of function. Basic human physiology studies the body's systems that function appropriately and as expected, while other disciplines like pathophysiology may look at the way body systems develop disease in attempts to find insight into how to cure diseases. Thus, human physiology deals specifically with the physiological attributes of the human body at various levels of organization, i.e. from cellular to tissue and ultimately, physiology at the biological system level. Human physiology is important because it imparts an in-depth understanding of the vital processes that the body does so as to attain the utmost goal of maintaining homeostasis. Objectives. To fully understand the mechanisms of human physiology. Human Physiology is the study of normal biological function from atoms to molecules, to cells to tissues, and to organs and organ systems. It is the integration of each of these elements that allows for the human body to function as a whole to accomplish particular tasks. In this course, we will focus on how the human body works through the activities of interconnected organ systems.
