Hot air engines, often called Stirling engines, are among the most interesting and intriguing engines ever to be designed. They run on just about any fuel, from salad oil and hydrogen to solar and geothermal energy. They produce a rotary motion that can be used to power anything, from boats and buggies to fridges and fans. This book demonstrates how to design, build, and optimise Stirling engines. A broad selection of Roy's engines is described, giving a valuable insight into the many different types and a great deal of information relating to the home manufacture of these engines is included. In depth description and analysis of the air engines throughout the 19th century during which the attention of mechanics has been directed to means for making air and gases available in driving machinery. The history of the Heated Air Engine dates as far back as the year 1699, when AMONTONS invented an atmospheric fire-mill in which heat was transformed in mechanical power. Stirling, Cayley, Ericsson and many other air engines are presented in a well ordered manner. A Hot Air Engine History. Source: After Knight's - American Mechanical Dictionary Date: 1874 Author: Edward Knight. For more than a century the attention of mechanics has been directed to means for making air and gases available in driving machinery. A Stirling engine is a heat engine that is operated by the cyclic compression and expansion of air or other gas (the working fluid) at different temperatures, resulting in a net conversion of heat energy to mechanical work. More specifically, the Stirling engine is a closed-cycle regenerative heat engine with a permanent gaseous working fluid. Closed-cycle, in this context, means a thermodynamic system in which the working fluid is permanently contained within the system, and regenerative describes
