

**Statistical Methods for Quality: With Applications to Engineering & Management :  
by Irwin Miller and Marylees Miller, Prentice Hall, 1995, pp368 ;\$NA**

This is one of the few books that successfully and seamlessly explores the statistical methods and its application in the quality and quality improvement. This book is for the novice user of statistics and for those readers who like to understand modern practice of quality methods which includes statistical methods as an important ingredient.

The terms statistics and quality are briefly introduced in the Chapter 1. The modern concept of quality and practices are further examined in the Chapter 2. For those readers who are not familiar with the modern quality movement and its leaders in the field, this chapter provides a short and comprehensive review. Total Quality Management get a terse and nice treatment here. The rest of the book arranged in a traditional statistical topic order. It includes probability distributions, sampling , statistical inferences, statistical process control, regression, design of experiments and reliability. At the end of each chapter, there is a section titled as “Application to Quality”. In this section it explores the application of the methods just learned in the chapter to the quality improvement.

A few typo can be found in the book, one is in section 5.2, page 105 , the denominator for  $z$  should be  $\sqrt{np(1-p)}$  , and another one is in page 286 third line from the bottom of third paragraph, it should be “D and C” instead of “B and C”.

As an introductory text book, this book has successfully achieved its purpose of showing the readers how to apply the theory taught to them to their work.

Statistical methods of quality control of production get the increasing recognition and distribution to the industries now. Scientific methods of statistical quality control of production are used in the following branches: in mechanical engineering, in light industry, in the field of utilities. Depending on scope of application allocate three main types of control cards: - control cards of Shukhart and similar him, allowing to estimate whether there is a process in statistically operated state. For the analysis and management of processes which indicators of quality are continuous sizes (length, the weight, concentration, temperature, etc.) usually use pair control cards, for example, the card for selective average value and the card of scope: X-card and R-card. Application of interest computations to engineering decision making. Analysis of engineering alternatives based on use of interest computations, valuations, depreciation, and cost estimates. Offered: ASp. Statistical tolerance design. Quality management and recent developments. Prerequisite: IND E 315 Offered: W. View course details in MyPlan: IND E 321. IND E 337 Introduction to Manufacturing Systems (4) Description of manufacturing systems. Also includes vendor sourcing and control tools, methods for establishing specifications and tolerances, quality function deployment, and other quality control techniques. View course details in MyPlan: IND E 521. IND E 524 Robust Design for Process Improvement (3) Introduction to robust design for process improvement.

Statistical quality control (SQC) is the application of statistical methods for the purpose of determining if a given component of production (input) is within acceptable statistical limits and if there is some result of production (output) that may be shown to be statistically acceptable to required specifications [688]. The wise quality control engineer does not wait for a process to go out of control. If he or she senses a trend (nonrandom or systematic variation) developing, statistical techniques are applied to test for trends, or runs, as they are called. Applying forecasting and the FMBE philosophy to aircraft automation requires only a slight stretch of the imagination. The training is designed both for specialists of quality services and for personnel involved in production processes. It considers 7 basic tools, which are used in the process of improving the quality management system (QMS). During the training participants develop statistical thinking way to consider developments, processes and their results in terms of variability; to analyze existing problems; to recognize existing problems and to analyze them by collecting statistics. During training participants practice: development of checklists - basic tool for acquisition and organizing primary data; histogramming - graphic display of quantitative product information; Cpk index - process performance index (probability of variations from standard) Keywords: statistical techniques, quality management. 1. Introduction. The use of statistical techniques in the practice of quality management of real and modern enterprises is considered in this work. The minimum necessary list of procedures for quality management of product and processes is determined in this standard. Formally according to the mentioned standard, statistical techniques (ST) are provided in the structure of these procedures. However, in reality these techniques are not used even in those enterprises whose systems of quality management have been successfully certificated. References. 1. Feigenbaum, A.V. Composition. Although statistical techniques are emphasized throughout, the book has a strong engineering and management orientation. This new edition continues to provide the most current, proven statistical methods for quality control and quality improvement. The use of quantitative methods offers numerous benefits in the fields of industry and business, both through identifying existing trouble spots and alerting management and technical personnel to potential problems. In this new edition, the author continues to explain how to combine the many statistical methods explored in the book in order to optimize quality control and improvement. The book has been thoroughly revised and updated to reflect the latest research and practices in statistical methods and quality control, and new features include: Updated coverage of control charts, with newly added tools. methods in engineering, and this should convince about necessity of statistical education in. technical universities.
